FOR SERA GRAY · VIA JEFF EDEN

The mesh is delivered. Let's get it into your people's hands.

The three-layer Enterprise Data Mesh we proposed together in December 2025 is built.

Historical reporting works. The AI agent answers cross-system questions safely through Teams.

The gap isn't capability. The gap is adoption — and that's the part I know how to close.

Adoption, not architecture.

Pour le bien-être du peuple.

WHAT FP&A GETS ON TUESDAY

Nick Burns's team can model reorganizations before Epiq commits to them.

The historical financial reconstitution is in production today. John Mullen uses it for back-office accounting; Nick Burns uses it for FP&A. It is already displacing Analysis for Office at scale.

The same delivered capability opens the DICOE modeling loop — restatement against alternate matrix organizations, alternate go-to-market on real history, synergy and complementary-product mix by geography.

Modeling runs in the Azure tenant with Dany Theriault, Arul Kuppaswamy, and the AI team. Validated answers operationalize in about two weeks. Delivered into Teams and Power BI. No third tool.

Modeling in weeks, not quarters.

WHAT BILLING GETS ON TUESDAY

Jaci Clark's team fixes revenue leakage at the source, not in the review queue.

Auto-billing is the floor Jaci's team put in place so the month closes on time. The leakage question is what happens before the suite runs, and whether the suite total and profitability are trending together.

The delivered platform tracks every edit to a draft sales order. Recurring edits — the same operators, the same accounts, the same corrections every month — are ranked by monetary weight and turned into master-data fixes at the source: contracts, Bullhorn profiles, rates, roles.

One source-fix removes the same edit from every future month for every operator. Statistical outliers surface as prioritized cases. Missing-line-item risk is detected, not only present-line-item risk. Forward-looking risk surfaces months ahead.

Time back to push billing into the field.

SHA-256: 32defb88d87416435e388a9d6868747d4475ab93bcb39c13372fd804d3ce970a

WHAT MATTERS AT YOUR ALTITUDE

The delivered access layer ports to AWS as-is.

Postgres, LangGraph, LangChain, delivered through Teams. Not tied to SAP. Not tied to Azure.

Anything you decide to build in AWS becomes immediately usable against governed enterprise data through the same Teams delivery layer your users are already in.

In parallel: the hardest piece of BW replacement is already done — the finance refunds against tuition, the most demanding reconciliation shape in the estate. The remaining scope in the currently committed engagement carries most of the way.

Portfolio reuse. Not a new spend. Not a rebuild.

THE COMMERCIAL SHAPE · THE ASK

About $80K left inside the current PO. That's the whole ask.

The prior PO is fully billed out. The current ERP-side PO was extended to cover the finish line and has roughly $80,000 of room still inside it.

That room funds the adoption motion — production rollout and training on the delivered platform, and a concrete billing workflow for Jaci Clark's team so adoption starts on real work. No new SOW to negotiate on this call. No new sponsor sign-off.

Six-week Adoption Fitness Check across four dimensions — Awareness, Confidence, Fit, Habit. One prioritized roadmap out the other side. Not a re-architecture. Not a rebrand. The small, disciplined services motion that turns a delivered capability into a used one.

Thirty minutes. Nothing to prepare. Just a call.
