

THE THREE-LAYER ENTERPRISE DATA MESH — AS PROPOSED DECEMBER 8, 2025

This is the picture you paid for. Everything after is that picture, delivered.

Proposed Data Mesh Summary

Data Architecture Layers

LAYER 1 - Cloud Data Fabric (AWS S3 + Steel Cloud connectors)

- S3 bronze/silver/gold zones (raw → curated → analytics-ready)
 - AWS Glue / Lake Formation (access control, quality checks)
 - Steel Cloud connectors (automated extraction from all sources)
- Certified data products published

LAYER 2 - Semantic & Governance Hub (DataSphere)

- Unified business entity models (Customer, Employee, Project)
 - SAP analytical views + replication flows
 - Non-SAP connectors (Workday, Salesforce, Bullhorn)
 - Catalog, lineage, compliance proof
- Governed API access via data products

LAYER 3 - AI & Analytics (DMZ)

- LangChain / LangGraph agents
- AWS SageMaker (optional ML training)
- Teams / BI front-ends

AWS provides: Scale, cost efficiency, open tooling

Datasphere provides: Business semantics, governance, audit trail

Steel Cloud provides: Multi-system connectors, proven patterns

PROPRIETARY AND CONFIDENTIAL

Steel Cloud × Epiq partnership deck, slide 8. Cloud Data Fabric · Datasphere semantic & governance hub · AI & Analytics DMZ.

Original slide, unchanged. The frame this note is written inside.

THE THREE-LAYER DELIVERED PLATFORM

Same three layers, one governed pipe from source to Sera's people.

THE DELIVERED PLATFORM

Three layers, one governed pipe from source to Sera's people.

Delivered. In Epiq's own tenant. On Epiq's own data.

EgD-EAE-003 · diagram 1 of 4 · three-layer delivered mesh

EVEglyphDesign · cream #fdfaf4 · orange #e87722

Source systems → governed data fabric → semantic & governance hub → AI access layer. In Epiq's tenant. The architecture on slide 1, moved from proposal to delivered.

The mesh is delivered. Now it needs adoption.

HOW TO READ WHAT FOLLOWS

This is a compounding capital asset in your portfolio, not a project that ended.

The mesh was purchased once. Everything the charter added — the three delivered blueprints, the semantic spine, the governed access layer, the component-level audit trail — was added to the same asset, in Epiq's own tenant, under your team's ownership. Unit economics improve every time it is reused.

Each new blueprint costs less than the last. Each new division that adopts it lowers the per-user cost. The audit trail becomes the template for the next domain. The LLM tier is interchangeable without touching the asset. It ports to AWS without a rebuild. Every reuse strengthens the reference for the next one.

The remaining ~\$80K in the current PO is not the tail-end of a services engagement — it is the smallest increment that turns a delivered platform into a compounding asset your teams draw on, unassisted, from Tuesday onward. What follows is the opening balance sheet of that asset.

Opening balance sheet, not project closeout.

HOW THE ERP CHARTER ACTUALLY GOT DELIVERED

Scoped by GitHub Cloud. Executed by Steel Cloud. Landed at contract price.

THE \$500K CHARTER · HOW IT ACTUALLY GOT DELIVERED

Scoped by GitHub Cloud. Executed by Steel Cloud. Landed at contract price.

Christmas 2025 execution handoff to Steel Cloud on the EVE surface. IC / JV / UJ blueprints v1.2–1.8 delivered on envelope.

Delivered at contract price, with the pattern retained.

WHAT COMPONENT-LEVEL AUDIT TRAIL ACTUALLY MEANS

Every technical object carries a numbered identity, end to end.

COMPONENT-LEVEL AUDIT TRAIL

Every technical object carries a numbered identity, end to end.

Sample: Vortex Build Run Book, phase 2 — 94 rows across five QAS/transport/cutover tabs.

EgD-EAE-003 · diagram 3 of 4 · trace — blueprint to transport

EVEglyphDesign · cream #fdfaf4 · orange #e87722

Three blueprints, five stations, 94 numbered rows in phase 2. IC / JV / UJ tracked from blueprint through transport.

Not a description of the build — a lookup for every piece of it.

WHY THE PATTERN IS PORTABLE TO ANY LLM

The record lives in the repository. The assistant is interchangeable.

THE PATTERN THAT TRAVELS

Governed project repository behind whichever LLM Epiq already runs.

EgD-EAE-003 · diagram 4 of 4 · LLM-agnostic pattern

EVEglyphDesign · cream #fdfaf4 · orange #e87722

Perplexity today. Copilot if Epiq standardizes there. Claude if a team wants to. Same repository, same answers.

Same repo, any assistant. No per-user lock-in.

FOR SERA GRAY · VIA JEFF EDEN

The mesh is delivered. Let's get it into your people's hands.

The three-layer Enterprise Data Mesh we proposed together in December 2025 is built.

Historical reporting works. The AI agent answers cross-system questions safely through Teams.

The gap isn't capability. The gap is adoption — and that's the part I know how to close.

Adoption, not architecture.

THE DECISION ON NEXT YEAR'S BUDGET — ALREADY DE-RISKED

You already have a clear path to a BW replacement.

The hard piece is done. The delivered platform reproduces the reconciliation shape that made BW hard to leave in the first place — the finance refunds against tuition, the most demanding case in the estate. That was the piece everyone was worried about.

The precedent is on the record: Analysis for Office was made redundant inside two weeks of the delivered platform receiving its security clearance. Nick Burns's team and John Mullen are running on the new surface today. No honest reason the remaining BW scope behaves differently — it is a smaller, better-understood problem than A4O was.

One bounded, fixed-cost piece of work retires the BW licensing and the people-cost that supports it. The savings pay for the rest of the adoption motion many times over. When the BW-vs-modernize decision lands on your desk next year, the proof for the modernize side is already in your own tenant, on your own data.

The proof is in hand before the decision lands.

WHAT FP&A GETS ON TUESDAY

Nick Burns's team can model reorganizations before Epiq commits to them.

The historical financial reconstitution is in production today. John Mullen uses it for back-office accounting; Nick Burns uses it for FP&A. It is already displacing Analysis for Office at scale.

The same delivered capability opens the DICOE modeling loop — restatement against alternate matrix organizations, alternate go-to-market on real history, synergy and complementary-product mix by geography.

Modeling runs in the Azure tenant with Dany Theriault, Arul Kuppaswamy, and the AI team. Validated answers operationalize in about two weeks. Delivered into Teams and Power BI. No third tool.

Modeling in weeks, not quarters.

WHAT BILLING OPERATIONS GETS ON TUESDAY

Stop chasing people at close. Catch the error upstream.

Auto-billing is damage control. By the time a bill is being corrected, or a prior period is being adjusted, revenue has already leaked. The goal is to fix the behaviour upstream, so Billing operations stops chasing people.

Identify where the team's hours actually go month over month, take those categories to a DMZ-bound model that reads data already in Epiq's sovereign repository, and get to root cause — not symptoms. The analysis deliverable is a prioritized list: monetary weight, root cause, upstream fix.

Operationalize only what earns operationalization, and land it in the surface people already open — Teams, Power BI, email. No new tool. No new training. Sales-order and change tables sit in the Azure tenant today (Datasphere wiring for that slice paused, walkable demo runs off the extract). Bullhorn stays on the AWS side where Epiq's own team already assembled it — architecturally right; the delivered layer plugs straight in.

Prevention upstream. Delivery in familiar surfaces.

THE PATTERN BEHIND THE SPECIFICS

A four-step shape that repeats — Epiq first, then everywhere it fits.

-
1. Catch errors upstream, not at close. Downstream automation is damage control; upstream enforcement is where the revenue lives.
 2. Use a DMZ-bound model against data the customer already holds in their sovereign repository. Nothing new is created; nothing leaves the customer's control.
 3. Deliver analysis as a prioritized list first — monetary weight, root cause, upstream fix. Operationalize only what earns it.
 4. Land the operationalized pieces in surfaces the customer's people already use — Teams, Power BI, email. The same shape a customer-platforms conversation at SAP would recognize. Epiq is where it gets its first defensible reference; the platform ports without a rewrite.

Same shape. Different tenant. First reference at Epiq.

WHAT MATTERS AT YOUR ALTITUDE

The delivered access layer ports to AWS as-is.

Postgres, LangGraph, LangChain, delivered through Teams. Not tied to SAP. Not tied to Azure.

Anything you decide to build in AWS becomes immediately usable against governed enterprise data through the same Teams delivery layer your users are already in.

Portfolio reuse of an asset you already own. Not a new spend. Not a rebuild.

Portfolio reuse. Not a new spend. Not a rebuild.

THE COMMERCIAL SHAPE · THE ASK

About \$80K left inside the current PO. That's the whole ask.

The prior PO is fully billed out. The current ERP-side PO was extended to cover the finish line and has roughly \$80,000 of room still inside it.

That room funds the adoption motion — production rollout and training on the delivered platform, and a concrete billing workflow for Jaci Clark's team so adoption starts on real work. No new SOW to negotiate on this call. No new sponsor sign-off.

Six-week Adoption Fitness Check across four dimensions — Awareness, Confidence, Fit, Habit. One prioritized roadmap out the other side. Not a re-architecture. Not a rebrand. The small, disciplined services motion that turns a delivered capability into a used one.

Thirty minutes. Nothing to prepare. Just a call.
